

ABSTRACT

Articulator (1), which may precisely reproduce the occlusion height in the mouth in preparing a denture excellent in occlusion properties and favorable to a patient, comprises: lower frame (23) provided with lower jaw model support (21) in its upper surface, detachably mounted on which support (21) is a lower jaw model (20); stand (30) mounted in a rear portion of the lower frame (23) to extend upright; upper frame (13) provided with an upper jaw model support (11) in its lower surface, detachably mounted on which support (11) is an upper jaw model (10); circular plates (40) which vary in thickness and are provided in each of the supports (11, 21), the circular plates (40) being selected so as to enable a jaw model mounting surface of each of the supports (11, 21) to be movable in parallel with each of the frames (13, 23).
